

Big Red Inlet Protection & Sediment Control

The Big Red Filter is a durable, reusable, and environmentally friendly inlet protector that filters sediment from runoff before it goes into the inlet. There are no pockets to fill, no velcro bags, no assembly etc. Simply place it in front of the inlet, making sure it lays in the contour and it is done.

Simple installation also translates into simple removal, cleanup and re-use at the next project or phase. Maintenance is simple as well by lifting the unit from the inlet, shaking the mud off of it, removing the sediment on the concrete, and placing the unit back. If it is severely filled with sediment, wash it out in a vegetated area and it is as good as new. All of these features and benefits combine to make the SWP-CI Big Red curb inlet protector the perfect choice for all curb inlet applications. It comes in 54” long for single curb inlets and 104” lengths for double curb inlets.

Advantages

- Easy to Install
- Versatile (curb inlets or drop inlets)
- Promotes sediment deposition before inlet
- Durable high-strength Geotextile
- Fully Resuable
- Made from 90% Recycled Materials
